

MNT21

TOKENOMICS

Fixed supply · transparent on-chain distribution

Version 1.0 | 16 September 2026

OFFICIAL CONTRACT ADDRESS

0xb7b974dd8d555d3f5f9f88cdd25498245985d23f

1. Core Model

MNT21 tokenomics starts from one non-negotiable on-chain fact: total supply is fixed at 30,100,000,000 MNT21. The reviewed contract does not provide post-deployment minting, burning, blacklist, pause, transfer tax or upgrade controls.

Parameter	Value
Total supply	30,100,000,000 MNT21
Decimals	18
Network	BNB Smart Chain
Contract	0xb7b974dd8d555d3f5f9f88cdd25498245985d23f
Creator / deployer	0xB90F4E1572ac872AAb096A7cc418f1CDd345e419
Supply expansion	None identified
Token tax	None identified
Burn mechanism	None identified

2. Distribution Principle

This version intentionally does not assign invented percentages to team, reserve, marketing, partners or ecosystem categories. Official allocation percentages should be published only after the project identifies the relevant wallets, confirms control where applicable, and reconciles the declared allocation with on-chain balances.

Until then, the blockchain holder table is the authoritative record of actual distribution.

3. Publication Standard for Future Allocation

1. Every allocation category must have a named purpose.
2. Every project-controlled category should disclose the corresponding public wallet address or a verifiable custody structure.
3. Percentages must sum to 100% of the fixed supply and reconcile to on-chain balances at the stated snapshot date.

4. Team or long-term reserve commitments should state lock-up/vesting terms only when an enforceable mechanism or publicly verifiable wallet policy exists.
5. Liquidity balances must be separated from ordinary holder concentration when analyzing distribution.

4. Liquidity

Parameter	Value
Primary DEX	PancakeSwap V3
Primary pair	MNT21 / USDT
Official pool	0x5205fbd874b20964d71f8c91a167811c291b968b
Liquidity model	Concentrated liquidity (V3)
Price	Market-derived; not pegged
LP risk	Range risk, impermanent loss, slippage and liquidity withdrawal risk

The official pool address should be labeled separately in holder analysis. Tokens held by the pool represent trading liquidity and should not automatically be described as an external whale position.

5. Value Flow

- No protocol-level holder yield is promised.
- No automatic buyback or redemption mechanism is embedded in the token contract.
- BNB network fees are paid to the network, not to MNT21 holders.
- DEX trading fees accrue according to the rules of the liquidity position and DEX, not by virtue of holding MNT21.
- Demand depends on actual use, voluntary acceptance, integrations and market liquidity.

6. Transparency and Monitoring

MNT21 Control should monitor holder count, concentration, new large addresses, official pool balances, V3 range status, liquidity changes, market metadata and reputation flags. Project-controlled wallets should be labeled so that treasury, reserve, distribution and liquidity balances are not confused with unidentified external holders.

7. Risks

High concentration, thin liquidity, inactive V3 ranges, large transfers and discrepancies between tracker valuation methods can materially affect displayed price and liquidity. Tokenomics figures should therefore be read together with current on-chain data.

9. Allocation Status

Status as of 16 September 2026: fixed supply confirmed; official creator and primary MNT21/USDT pool identified; a complete project-wallet map and approved allocation percentages are not yet included in the source materials used for this document. This Tokenomics version therefore publishes the verified economic framework without fabricating allocations.
