

MNT21

WHITEPAPER

Settlement and utility token on BNB Smart Chain

Version 1.5 | 16 September 2026

OFFICIAL CONTRACT ADDRESS

0xb7b974dd8d555d3f5f9f88cdd25498245985d23f

Important notice

This document describes the purpose, technical properties and public infrastructure of MNT21. It is not personalized investment advice, a public offer, a securities prospectus, or a guarantee of liquidity or token value. MNT21 is not a bank deposit, electronic money, or a stablecoin and does not guarantee redemption into fiat currency.

Primary verification rule: the definitive on-chain identifier is the complete smart-contract address above. Names, tickers, logos and websites can be copied by third parties.

1. Executive Summary

MNT21 is a fungible BEP-20 token on BNB Smart Chain intended for value transfer between compatible wallets and Web3 applications, voluntary settlement between participants, and use in decentralized liquidity infrastructure. The protocol does not peg MNT21 to the US dollar, Russian ruble, or any other asset. Market price is determined by supply, demand and available liquidity.

2. Token Profile

Parameter	Value
Name / Ticker	MNT21 / MNT21
Network	BNB Smart Chain (BSC), Chain ID 56
Standard	BEP-20 / ERC-20-compatible interface
Contract	0xb7b974dd8d555d3f5f9f88cdd25498245985d23f
Total supply	30,100,000,000 MNT21
Decimals	18
Supply model	Fixed supply; no post-deployment mint identified
Built-in token tax	None identified; network gas is paid in BNB
Creator / deployer	0xB90F4E1572ac872AAb096A7cc418f1CDd345e419
Code status	BscScan Source Code Verified - Exact Match

3. Purpose and Use

- Transfers between compatible BNB Smart Chain addresses.
- Voluntary settlement between participants who agree to use MNT21.
- Use in trading pairs and liquidity pools on compatible decentralized exchanges.
- Integration with wallets, analytics services and Web3 applications through the standard token interface.
- Technical value-transfer use subject to applicable law and counterparty requirements.

Holding MNT21 does not by itself confer ownership in a legal entity, dividend rights, corporate governance rights, or an unconditional right to exchange the token for fiat currency.

4. Technical Architecture

MNT21 uses the standard BEP-20 balance and allowance model. The reviewed source implements transfer, approve, transferFrom, balanceOf, totalSupply and allowance. Based on the project's internal source-code analysis, the deployed design is minimal and does not expose owner, mint, burn, blacklist, pause, tax, proxy-upgrade or arbitrary third-party balance controls.

BscScan source-code verification confirms that the explorer matched the published source to deployed bytecode; this status is not an independent security audit.

5. Issuance, Distribution and Tokenomics

The total supply is 30.1 billion MNT21 and was created at deployment. Current distribution is determined by on-chain balances and transfers. This whitepaper does not invent allocation percentages for team, marketing, partners or reserves. A separate Tokenomics document defines the publication framework and requires any future allocation schedule to identify the relevant project wallets and be reconciled with blockchain data.

A displayed fully diluted valuation or market capitalization may be economically misleading when liquidity is thin. Multiplying the latest pool price by total supply does not mean the full supply can be sold at that price.

6. Liquidity and Price Formation

Parameter	Current official reference
DEX	PancakeSwap V3
Pair	MNT21 / USDT
Pool	0x5205fbd874b20964d71f8c91a167811c291b968b
Price formation	Algorithmic pool price; varies with trades, depth and active V3 range
Liquidity status	Dynamic; may be added, withdrawn or become inactive outside a concentrated-liquidity range

Tracker liquidity figures may differ materially because platforms can value concentrated-liquidity positions differently. Users should inspect the pool composition and active range rather than rely on a single headline liquidity number.

7. User Security

1. Verify BNB Smart Chain and the full contract address before every transaction.
2. Use a small test transfer before a material transaction.
3. Never disclose a seed phrase, private key, backup QR code or keystore file.
4. Review token approvals and revoke unnecessary allowances.
5. Do not send tokens directly to the MNT21 contract address; the reviewed contract has no recovery mechanism.

8. Governance and Immutability

Based on the reviewed source, the MNT21 contract is not designed as an upgradeable proxy and no post-deployment administrative authority was identified. Website content, social channels, DEX pools and public metadata may change without changing the token contract or on-chain balances.

9. Compliance

Participants are responsible for applicable AML/CFT, sanctions, tax, counterparty and cross-border transaction requirements. The project does not endorse concealment of source of funds, circumvention of mandatory restrictions or unlawful use.

10. Principal Risks

Risk	Description
Market	Price can change sharply and available liquidity may be insufficient for the desired trade size.
Concentration	Large holders or liquidity providers may materially affect the market.
Smart contract	Verification and internal review do not eliminate unknown defects or integration risks.
Network	BNB Chain congestion, fees, RPC outages or protocol changes can affect transactions.
Custody	Loss or compromise of private keys can cause irreversible loss.
Counterparty	DEX interfaces, bridges, exchanges and other services may fail or be compromised.
Regulatory	Applicable laws and restrictions may change.
Information	Fake tokens, websites and accounts may copy the MNT21 name.

12. Review Status and Roadmap

- Maintain consistent public metadata across BscScan, market trackers, website and official channels.
- Publish an immutable IPFS copy of approved project documents.
- Complete the scheduled expert whitepaper review on 1 October 2026 and publish the resulting revision.
- Obtain an independent smart-contract security assessment before presenting any technical review as a public audit.
- Publish project-wallet labels and any approved allocation schedule before describing distribution percentages as official.

13. Internal Technical Review Summary

The project's internal source-code analysis dated 20 August 2026 reported 0 Critical, 0 High, 0 Medium, 2 Low and 3 Informational findings. It described a simple fixed-supply implementation with a limited attack surface. This internal review is not an independent security certificate.

14. Conclusion

MNT21 is a fixed-total-supply token on BNB Smart Chain intended as a technical instrument for transfer, voluntary settlement and compatible Web3 integrations. Safe use requires verification of the contract address, independent assessment of liquidity, protection of private keys and compliance with applicable law.
